API Reports

Explore API reports and data.

- API Reports Page

API Reports Page

Overview

The API Reports page provides the means to oversee connection endeavours undertaken by an individual API account. This functionality empowers you to create comprehensive reports encompassing several aspects: the tally of your call instances, the count of prosperous label applications, and the count of unsuccessful ones.

This guide will demonstrate the process of producing and comprehending a report within the API Reports page of the Voila.

Filters

The information presented on this page is initially based on a 7-day timeframe. Nevertheless, you can modify this scope by utilising the filtering mechanism accessible through the "Show Filters" button.

The report will exhibit the API Calls data within a predefined date range upon generating. Illustrated in the accompanying image, you'll notice a segment dedicated to manually configuring your desired date range.

Additionally, situated beneath this section is a feature allowing seamless navigation between different accounts. This feature streamlines the process of switching API accounts.

API Report

- **Endpoint URL:** This denotes the destination in Voila where your request is directed. By inspecting the URL, you can extract valuable insights, such as the targeted courier and the purpose of the requests, which may involve tasks like label creation or label

cancellation.

- **Call Count:** This figure represents the aggregate count of label requests dispatched through the courier.

  Successful Requests: This category showcases the count of requests executed successfully via the courier.
- **Failed Requests:** Within this category, you can observe the tally of failed requests during transmission.
